Hiring Team

Re: AI Engineer, Forward-Deployed Engineer and Software Engineer roles

Dear Hiring Team,

I build AI systems that people rely on in production: voice agents that phone employees and turn what they say into structured reports, and multi-agent systems that learn how back-office work actually gets done and then automate it. At Imbesideyou in Tokyo, I work across two AI products that together bring in **¥23M+ in monthly revenue**, for clients including **NTT DATA, Toyota, DeCoA and Mitsubishi Motors**.

On the process-mining platform, I built the Rust/Tauri desktop capture agent and led the capture contract the OCR/LLM pipeline is built on. I built a **multi-agent automation-delivery system on Claude** with an MCP server and LLM-as-judge evals, and designed the platform's identity layer with audience-scoped tokens and MFA. On the voice-AI product I owned the platform end to end: **Vapi** agents, Japanese speech tuning, call-concurrency control and per-tenant LLM spend caps.

Before that, at ZS Associates, I built Databricks and Redshift pipelines and the client-side React interface for a **$2M data-analytics program at Amgen**, turning complex backend data into dashboards for business decision-makers.

I'm looking for AI Engineer, Forward-Deployed Engineer or Software Engineer roles where I can ship agentic and LLM systems that real users depend on, on-site, hybrid or remote, in any country. My work is at harshavardhan-dev.vercel.app, and I'd be glad to walk you through any of it.

Sincerely,
Harsha Vardhan
